

AI FOR INNOVATIVE LEADERS

AI CLONING & ENTERTAINMENT INDUSTRY

GAWON KIM, MINSEO KIM, JIEUN LEE

DEFAMATION OF KIM SOO HYUN

Kim Se-ui, head of the Garosero Research Institute, attends a pre-arrest suspect questioning

Press Conference

Mar 31, 2025

Kim Soo-hyun officially denies dating allegations and claims the bereaved family is framing him as a pedophile.

Police Conclusion

May 21, 2026

Investigation determines that audio files and text messages were entirely AI-fabricated.

Arrest & Official Vindication

May 27, 2026

YouTube channel Garo Sero Institute's operator Kim Se-ui is arrested for defaming the actor.

“...police are said to have been able to determine whether the recordings were manipulated by analyzing the voice data in the audio files. This may have been possible because the material had been broadcast since March of last year. **Had the evidence been manipulated using today's AI technology, it might not have been so easy to detect.”**

(Source: Yonhap News Agency)

AI manipulation technology is improving faster than verification systems can respond.

Why AI Cloning Is Rapidly Proliferating...

- Deepfake technology has shifted from traditional editing to deep learning-based generation.
- GANs and diffusion models now produce more realistic synthetic faces, voices, and videos.
- Commercial tools make fabrication accessible to non-experts.
- Public figures provide abundant training data through interviews, dramas, livestreams, and social media.
- As a result, fabrication becomes faster, cheaper, and harder to detect.

It took minutes to fabricate. It took a year to prove it was fake.

AI voice cloning disproportionately targets the entertainment industry because the data that makes celebrities famous is the same data that makes them trivially easy to fabricate. And by the time the truth emerges, the damage is already done.

THE TOOL

AI voice cloning

Trained on publicly available audio
— interviews, dramas, variety
shows

THE VICTIMS

Celebrities

Most data online = easiest to
clone. Fame becomes a
vulnerability.

THE PROBLEM

Responses are too slow

Legal, forensic, and platform
takedowns all react after the
damage is done

this isn't me

"The barrier to fabrication is now essentially zero."

HOW IT WORKS

- 1 Data collection**
Publicly available audio — interviews, dramas, variety shows. No hacking needed.
- 2 Deep learning training**
Model learns pitch, cadence, vocal patterns. More data = more convincing clone.
- 3 Generation**
Model outputs new audio saying anything — in the target's voice.

HOW ACCESSIBLE IT IS

\$5 /month — ElevenLabs

No technical expertise required. Anyone with a subscription can clone a voice in minutes.

THE KAKAO CONNECTION

Fake chat logs required even less — a text generator prompted to mimic conversational style, with names and photos edited on top. Two tools. Minutes of work. Months of damage.

WHY CELEBRITIES ARE ESPECIALLY VULNERABLE

Celebrities are especially easy to clone because fame produces the public data AI needs.

The Training Data Problem

- AI systems improve with more public examples, and celebrities have plenty: interviews, livestreams, press events, and social media. That gives AI repeated samples of their face, voice, and style.

This creates **training data bias**, as people with more public exposure are easier to clone.

Social Vulnerability

- Celebrities are also vulnerable because fans often feel personally connected to them. That makes fake voice messages or videos more believable and more likely to spread (Gleason et al., 2017).

Detection is still **imperfect**, and verification often **takes time**.

THE CORE DANGER: FABRICATION OUTPACES VERIFICATION

- AI can make celebrity fabrications believable and harmful before the truth catches up.

Lost Trust

False content can damage credibility fast

Lost Deals

Opportunities can disappear before debunking

Emotional Harm

Damage continues even after the truth emerges

Viral Speed

Fake content spreads faster than corrections

→ **Problem: Verification is much slower than circulation!**

CURRENT RESPONSES

LEGAL

- Taylor Swift's AI-generated NCII spread widely on X before legal action followed
- The DEFIANCE Act gives victims a civil path to sue deepfake creators/distributors
- But lawsuits, subpoenas, and investigations begin after viral circulation
- Anonymous accounts, overseas IP addresses, and public Wi-Fi make perpetrators hard to identify

TECHNICAL

- Digital forensics can help prove whether content is fake
- But it may not quickly identify the creator, source, or distribution chain
- AI-generated content often lacks EXIF metadata and camera fingerprints
- C2PA can verify provenance, but metadata can be stripped or lost

Harm spreads first. Truth and accountability come later.

SOLUTIONS

01

LEGAL REFORM

- Expand deepfake regulation beyond politics and sexual crimes.
- Define unauthorized celebrity voice and image cloning as **synthetic identity fraud** when used for defamation, harassment, or profit.
- Strengthen penalties when AI cloning causes reputational or financial harm.

02

PLATFORM REDESIGN

- Create a **fast-track reporting** category for AI voice/deepfake impersonation.
- Send reported celebrity deepfake cases directly to specialized human review teams.
- Reduce the delay caused by ordinary misinformation reporting systems.

03

MONETIZATION CONTROL

- **Temporarily freeze monetization** for content flagged as AI-based defamation or identity fraud.
- Prevent creators from earning ad revenue, Super Chats, or sponsorship benefits while verification is ongoing.
- **Remove the financial incentive** behind viral fake scandals.

04

WARNING AND LABELING SYSTEM

- Add visible labels to suspicious synthetic media, such as: "This video contains AI-generated or altered audio."
- Make the label permanent and difficult to ignore.
- Help audiences question the content before treating it as real evidence.

05

REALISTIC LIMITATION

- C2PA and blockchain systems cannot prove that every unregistered file is fake. These tools have limitations.
- → They should work as an early-warning system, not a complete replacement for forensic investigation.

OVERALL...

The solution should be **LAYERED**

GOAL

- **To punish deepfake creators after harm occurs, and to stop fabricated celebrity content from gaining credibility in the first place.**

THANK YOU
FOR WATCHING
